

Mapping Preferences

Last Modified on 02/23/2022 1:43 pm CST

To set up preferences in Agvance Mapping, go to *Mapping / SSI / Mapping Preferences*.

- **Grower Name Display** – Select the company’s preference from the drop-down menu to display the grower name by either Last Name First or First Name First.
- **Background Road/Image Folders** – The *Background Road* and *Background Image* folders usually remain empty unless requesting imagery to be custom installed.
 - BING imagery is recommended. Select the *Use BING Imagery* options for both the *Image* and *Road* folders.
 - NAIP imagery can be used if preferred or if connectivity is an issue. Directions to Download NAIP Imagery are available [here](#).
- **Lime Rating Units/Manure Rating Units** – Set units to meet company or grower specific requirements and select the appropriate rating unit for each from the drop-down menu.
- **Special Mapping Instructions** – Display special mapping instructions appearing on-screen only (cannot be printed on the map). Optionally set instructions for a specific location or grower.
- **Select Logo** – Choosing **Select Logo** opens a second window. Indicate *Where to Save* and the *Logo Path*. Choose **View Current** to see a preview of the logo.
 - Store a single logo at the *Company* level to display on all reports. Add additional logos for a specific grower, location, or territory. If a logo is not indicated, the logo space on the report is blank.
 - The size of the image automatically adjusts to fit the space provided. No minimum/maximum resolution or pixel specifications are required.
- **Look and Feel** – Set the *Look and Feel* of the *Mapping* window by going to *File / Preferences / Application Skin*. To view various skin options, set the *Style* to *Skins* and choose a *Skin Name* from the drop-down. The window appearance automatically changes to display the selections. Once finding a preferred *Style*, select **OK** to save.
Note: Changing the *Skin* preference is a user-specific setting only affecting the Mapping module.
- **Window Docking** – Dock windows on the *Mapping* screen to be visible at all times or tab the window to allow for more room in the *Mapping* pane.
 - To dock a window to the *Mapping* pane, select and drag the pointer/title bar of the window to dock to a different location on the screen until small directional boxes appear.
 - Move the pointer/title bar to one of these directional boxes. The shaded area displays the location where the window will be placed.
- **Tabbed Windows** – Select the **Thumb Tack** symbol to pin/unpin the *Mapping* pane. To view the window again, hover over the tab.
