NAIP Data is Downloaded but Only Part of the County Shows

Q. The NAIP data has been downloaded for a county but only part of the information is showing for that county.

A. There are some cases where a large county may have been split into more than one SID file. Typically, the files are all stored in the same directory like *Server**C*\:*NAIP*\ for example. If there is more than one SID file for a county, the files need to reside in their own folders. For a county that has more than one SID file, set up a folder for each. For example: *Server**C**NAIP**CountyN*\ and *Server**C**NAIP**CountyS*\. When working with fields in this county and needing to apply the NAIP background data, change the NAIP storage path to point to the folder for that specific area of the county.
