Exporting Boundary Shapefiles

Create multiple shapefile boundaries for numerous customers at one time formatted and ready to import into SKY Mapping.

1. In Agvance, go to *Hub / Setup / Company Preferences / API / Mapping Interface*.

2. Select the **Export Folder** icon from the *Export Shapefiles* section of the window and choose the folder where the exported shapefile boundaries will be saved.

3. When the *Export Folder* path is entered, select **Create Shapefiles**.

4. On the *Select a Field* window, choose a customer on the left. Use the **Arrow** icons to move Fields to the selection window.

5. Choose **Done**. The utility will process the request and a pop-up notification displays the number of shapefile boundaries created.

6. The file is saved at the *Export Folder* path selected in Step 4 and can now be imported into SKY Mapping.
   - If the *Export Folder* created was *c:\NewExport*, the following folders will be created:
     - *c:\NewExport\CustomerID*
     - *c:\NewExport\CustomerID\FarmID* (This folder will contain the Field boundary files. The name of the file is the Field ID.)
