

Classifications on Agvance Reports

Last Modified on 06/24/2025 10:58 am CDT

When choosing classifications to narrow report results in Agvance, the following options are available to choose from at the bottom of the *Classifications* window:

- **Include if ANY are true** – Returns only those items that exist in any of the selected Classifications.
- **Include if ALL are true** – Returns only those items that are in all of the selected Classifications.
- **Include if ANY are false** – Returns only those items that are NOT in all of the selected Classifications.

Example: The database contains four Products: A, B, C, and D. Classification Anhydrous has Product A and Classification VRT has Products A and B. Using *Include if ANY are false* will return Products B, C, and D when both Classifications are selected.

- **Include if ALL are false** – Returns only those items that are not in any of the selected Classifications.

Example: The database contains four Products: A, B, C, and D. Classification Anhydrous has Product A and Classification VRT has Products A and B. Using *Include if ALL are false* will return Products C and D when both Classifications are selected.
